

WASTE CONTAINMENT

Most waste is generated over a period of time and has to be stored at the waste generator before transportation and disposal. This can normally be achieved utilising standard equipment but often a more innovative approach is called for.

Interwaste designs and produces custom plant and equipment to suit more problematic projects. Whether it is a specialised holding tank for toxic hydrocarbon waste streams or a specially shaped 'half skip' for use on-board commercial shipping vessels, the company utilises its' experience and the expert services of its' engineering partners to ensure that the most efficient methodology is utilised at all times.

Containment is often considered together with minimisation. Generators of high volume, low mass waste often utilise on-site compactors to reduce the volume of those materials, resulting in substantial savings on transport costs.

Static waste compactors are available in various configurations, for the on-site compaction of high volume, low density industrial wastes. These provide volume reduction of up to 75%, thereby reducing transportation costs dramatically and with its sealed compaction unit provides a long term solution to wind pollution and pilferage.

In addition, machines can be supplied on a monthly rental basis or as an outright purchase and maintenance may be carried out by our own specifically trained technicians.

Compaction units require installation onto a flat 200mm concrete slab with wet waste drainage and a 30A 3 phase power supply. A wash down facility would prove invaluable. The flexibility of the various systems can facilitate many options including multiple container positions for one compactor. It is strongly recommended that an on-site feasibility study be completed before any final equipment decisions are made.

For further information on our wide range of products and services or for details on our operational centres throughout southern Africa please contact Head Office.
